

METHOD AND SYSTEM OF PRINTING ISOLATED SECTIONS FROM DOCUMENTS

ABSTRACT

5

A system, method, and related computer program for isolating sections of data from a document for printing said designated data from received documents from the World Wide Web and like networks, or from documents such as pdf files, source code files, presentation, spread sheet, and Word documents. An interactive browser associated with each of the receiving stations in the network accesses received documents from the network and displays the documents at any receiving display station. The user is then able to isolate designated data and print only the designated data without the extraneous displayable data included in the received document. The browser further includes means for copying the designated data to create a secondary document having a document format structure which is independent of the format structure of the underlying received document. There is provided mean for storing this secondary document in association with the browser which is independent of said received Web document.
